

FABRIC MATERIAL PROCESSING METHOD

ABSTRACT OF THE DISCLOSUREA

A fabric material processing method of processing a fabric material to make
5 the top surface hydrophobic and the bottom surface hydrophilic by: coating the fabric
material with a layer of nanostructured metal liquid and dipping the fabric material in a
nanostructured water repellent solution after drying of the nanostructured metal liquid,
and then spraying a solvent on the bottom side of the fabric material to remove water
repellant from the bottom side of the fabric material, and then grinding the fabric
10 material to remove nanostructured metal from thee bottom side of the fabric material,
and then drying desizing the fabric material, and then washing the fabric material with
clean water, and finally drying the fabric material again.
